

About Me

I am a graduating software engineering student with a passion for the development and application of artificial intelligence algorithms. I place particular emphasis on security considerations in AI, and my career dream is to provide stable, reliable AI applications that fully respect personal privacy and identity. Through related research, I am gradually turning this dream into reality.

I spent two years of my undergraduate studies at Northeastern University (China) and UTS separately, and formally began my research at UTS.

During my university years, I joined a research group on trustworthy AI and participated in numerous conferences. In the process, I mastered various AI technologies and gained an understanding of the cutting-edge research directions and topics in my field. I assisted in reviewing several conference papers and plan to publish my own paper soon.

I maintain my enthusiasm and diligence, striving to seize every opportunity. I firmly believe in lifelong learning and hope that both academic research and application development will allow me to gain a deeper understanding of AI technology and become an expert in this field.
